## More Details

The six basic questions are as follows

1) When does your first staff member (teaching) arrive? 2) When does your last staff member (teaching) leave?
2) What is the number of teaching staff?
3) What is the total number of children present on your maximum enrollment day? What are their ages? Which staff members are assigned to each age group (if there is vertical grouping)?
4) When does your last child arrive?
5) When does your first child leave (if vertical grouping, give breakdown according to age)?

After these questions are answered, then the day care monitor will compute the number of contact hours ( CH ) between staff and children using the above formulas. In Formula \# 1; NC = total number of children present on the maximum enrollment day; $\mathrm{TO}=$ total number of hours the center is open; $\mathrm{TH}=$ total number of hours at full enrollment; $\mathrm{CH}=$ contact hours between staff and children in any type of caring arrangement. After the CH is computed, the data is then put into another formula, which will determine the relatively weighted contact hours for horizontal grouping (RWCH), or the relatively weighted contact hours range (RWCHR) for a vertically grouped program.

In the formulas above, $\mathrm{NC}_{0}=$ total number of children on the maximum enrollment day. $\mathrm{TO}_{0}=$ total number of hours the center is open. $\mathrm{TH}_{0}=$ tota number of hours at full enrollment. RWCH = relatively weighted contact hours - indicator of compliance for horizontally grouped programs. RWCHR = relatively weighted contact hours range - indicator of compliance for vertically grouped programs. TA = total number of teaching staff. $\mathrm{NCi}=$ total number of infants. $\mathrm{NCp}=$ total number of preschoolers. $\mathrm{NC}_{5}=$ total number of school age children. THp = total number of hours at full enrollment with preschoolers. $\mathrm{THi}=$ total number of hours at full enrollment with infants-toddlers. $\mathrm{TH}_{s}=$ total number of hours at full enrollment with school-age children. Once the RWCH or the RWCHR figures are computed it can be determined if the programs are within compliance by using Table of Conversions for RWCH and RWCHR (see Table).
This Table is computed from an ideal where TO and TH both equal eight hours. In other words, all staff and children arrive and leave at the same time, which is an ideal programmatic set-up. By using the Table of Conversions, it is relatively easy to compute if a program is within compliance. In the Table of Conversions I = infant-toddlers; $\mathrm{P}=$ preschoolers; $\mathrm{S}=$ school-age children. For example, in the Table of Conversions, look under the NC column and match the number with the same on in the formula. Then look under the CH column and match the number with the same one in the formula. Now look under RWCH in the P (preschoolers) column. In reading the Table of Conversions, if a program received a score equal to or less than the score on the Table it will always be within compliance. If the program receives a score greater than the score on the Table for that particular category, then the program will always be out of compliance. The aspect of the above theoretical model is that it takes both time and numbers of staff into account. It is a simple one-shot mathematical calculation, and it can determine if a program is within compliance or not.
